Warning: **DO NOT** destroy or lose this manual. Please read the manual thoroughly. Store manual for easy retrieval as a future reference. As a result of product improvement, specification and design of this water heater are subject to change without advanced notice. Consult your manufacturer or your dealer for details concerning your product. The diagram pictured on front cover is a reference image; please take the appearance of the actual product as the standard.

INTENDED USE

This manual will provide the installer with recommendations and basic instructions for the proper installation and adjustment of the water heater. This manual will explain to the owner-operator: the features, operations, safety precautions, maintenance, and troubleshooting steps of the water heater. This manual includes a replacement parts list.

The instructions must be read carefully by the owner-operator to ensure that they can adjust the water heater or operate the water heater proficiently. Please seek professional advice if you find that you do not understand the instructions.

For additional questions regarding service, warranty, and maintenance that are not covered by these instructions, please contact the seller from whom your product was purchased.

SAFETY INSTRUCTIONS

For Your Records

Write the model and serial numbers here:

Check rating label on the front of your water heater for these numbers.

Keep track of sales slip and proof of original purchase. This evidence is needed by owner to obtain service under warranty.

Read This Manual

Preventative care by owner can maximize the life of the water heater. Please refer to **CARE & CLEANING** section and **TROUBLESHOOTING TIPS** section. This may prevent you from making a service call for your unit.

Read The Safety Information

Your safety is important. The safety of others is important. There are important safety messages in this manual and for your water heater. Obey all safety messages.

Located to the left is a symbol for safety alert. That symbol indicates Important Safety Information regarding potential hazards that can cause harm or death to you and others.

Please see explanation of symbols below for “**DANGER**”, “**WARNING**”, “**CAUTION**” or “**NOTICE**”.

Explanation of symbols

DANGER

This represents a serious hazard that must be taken seriously to avoid death or injury to yourself and others.

WARNING

This represents a potentially hazardous situation. Warnings should be noted so that users can avoid situations that could result in damage to property and/or death or serious injury.

CAUTION

This symbol indicates owner/user should take care to avoid minor or moderate injury in a potentially harmful situation.

NOTICE

This symbol is to indicate that attention should be directed towards a specified procedure or maintain a specific condition.

Important Safety Information - Read All Instructions Before Using

⚠ DANGER - WATER TEMPERATURE SETTING

Please consider safety and energy conservation when selecting the water temperature setting of water heater.

Severe burns can occur from hot water.

In extreme cases, death from scalding can occur. As owner-operator, be sure to read and follow the warnings outlined on the label pictured right. This label is also located on the water heater.

🔊 NOTICE

It is possible to reduce point of use water temperature with a mixing valve. The way that mixing valves work is that they mixing hot and cold water in branch water lines. Please note that this product does not include a mixing valve. During installation and use, it is necessary to purchase and install a mixing valve separately. It is recommended that a mixing valve complying with the Standard for Temperature Actuated Mixing Valves for Hot Water Distribution Systems, ASSE 1017 before being installed. See page 33 for more details. For assistance, please contact a licensed plumber for further information.

To use demand response for your water heater, use a thermostatic mixing valve (that conforms to ASSE 1017) on the hot water supply line following instructions.

If the SUPPLY CORD is damaged, it must be replaced by the manufacturer, its service agent or similarly qualified person in order to avoid a hazard.

Heat Pump Strictest operation environment: 3°C-43°C. Heating element Strictest operation environment: -15°C-46°C. Strictest operation environment: -15°C-46°C. Temperature can set range is 43°C-65°C.

The vent shall not be obstructed.

Time/Temperature Relationship in Scalds

| Temperature | Time To Produce a Serious Burn |
|--------------|--------------------------------|
| 120°F (49°C) | More than 5 minutes |
| 125°F (52°C) | 1 1/2 to 2 minutes |
| 130°F (54°C) | About 30 seconds |
| 135°F (57°C) | About 10 seconds |
| 140°F (60°C) | Less than 6 seconds |
| 145°F (63°C) | Less than 3 seconds |
| 150°F (65°C) | About 1 1/2 seconds |
| 155°F (68°C) | About 1 seconds |

The guide above shows how fast it is possible to be scalded based on the output temperature of the water. Use this guide to determine the proper water temperature for your home.

⚠ DANGER

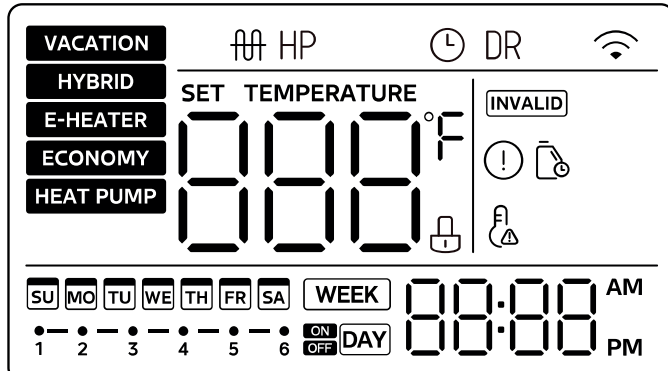

This appliance is not intended for use by persons (including children) with reduced physical, sensory or mental capabilities, or lack of experience and knowledge, unless they have been given supervision or instruction concerning use of the appliance by a person responsible for their safety.

⚠ DANGER

This water heater can make water hot enough to cause severe burns instantly, resulting in severe injury or death. Be careful to have children, disabled and elderly not exposed to scald risk. Before setting temperature at water heater, see instruction manual. Test water temperature before bathing or showering. Refer to manual for temperature limiting valves reference.

Children should be supervised to ensure that they do not play with the appliance. Before the water heater is shipped from the factory, it was set to a temperature of 120 °F (49°C) to reduce the risk of scald injury (For CAN - factory set to 140 °F (60.0°C)). This is done to comply with safety regulations. Refer to illustration below shows the water temperature setting. Refer to the Operating instructions on Page 27 in this manual for detailed instructions in how to adjust the water temperature.

⚠ DANGER

It is important to note that higher temperatures of water increases scald risk.

Relief Valve Warnings

Safety Devices

Temperature sensors, overheat sensors and switches and a Pressure & Temperature Relief (PTR) valve are supplied for the water heating system.

- DO NOT tamper with these device.
- DO NOT remove these devices.
DO NOT seal the PTR Valve or drain pipe.
- DO NOT operate the system unless each device is properly fitted.

Pressure & Temperature Relief (PTR) Valve

Please note that this valve is located near the top of the water heater and is essential for safe operation. It is normal for the valve to release a small quantity of water through the drain line during heating.

Lower lever carefully until water flows from drain line.

BATTERY WARNING

WARNING:
Contains coin battery.

WARNING

INGESTION HAZARD: This product contains a button cell or coin battery.

• **BATTERY WARNING: KEEP OUT OF REACH OF CHILDREN;**

- If the battery compartment (if applicable) does not close securely, stop using the product and keep it away from children.
- If you think batteries might have been swallowed or placed inside any part of the body, seek immediate medical attention.

WARNING

- **INGESTION HAZARD:** This product contains a button cell or coin battery.
- **DEATH** or serious injury can occur if ingested.
- A swallowed button cell or coin battery can cause **Internal Chemical Burns** in as little as **2 hours**.
- **KEEP** new and used batteries **OUT OF REACH of CHILDREN**.
- **Seek immediate medical attention if a battery** is suspected to be swallowed or inserted inside any part of the body.

BATTERY WARNING

KEEP OUT OF REACH OF CHILDREN.
Swallowing can lead to chemical burns, perforation of soft tissue, and death. Severe burns can occur within 2 hours of ingestion. Seek medical attention immediately.

WARNING

- Remove and immediately recycle or dispose of used batteries according to local regulations and keep away from children. Do not dispose of batteries in household trash or incinerate.
- Even used batteries may cause severe injury or death.
- Call a local poison control center for treatment information.
- Non-rechargeable batteries are not to be recharged.
- Do not force discharge, recharge, disassemble, heat above (-20-70 °C) or incinerate. Doing so may result in injury due to venting, leakage or explosion resulting in chemical burns.
- Ensure the batteries are installed correctly according to polarity (+ and -).
- Do not mix old and new batteries, different brands or types of batteries, such as alkaline, carbon-zinc, or rechargeable batteries.
- Remove and immediately recycle or dispose of batteries from equipment not used for an extended period of time according to local regulations.
- Always completely secure the battery compartment. If the battery compartment does not close securely, stop using the product, remove the batteries, and keep them away from children.
- Battery type: CR2032
- Battery nominal voltage: 3.0 V

WARNING

- DO NOT remove safety devices or tamper with them.
- ENSURE that all safety devices are fitted and in working order BEFORE operating the water heater.
- The PTR Valve and drain pipe MUST NOT be block or sealed in any way.
- The PTR valve or its drain must NEVER be blocked for any reason. Every 6 months the easing gear MUST be operated in order to verify that they are not blocked and to remove lime deposits. Water heater may fail if these steps are not followed.
- Contact local plumber without delay if the PTR valve does (1) not discharge water when the easing gear lever is opened, or (2) does not seal again when the easing gear is closed. The PTR valve is not serviceable and must be replaced if damaged.

Excessive Discharge From Safety Devices

Pressure & Temperature Relief (PTR) Valve (Required) and Expansion Control Valve (ECV)-(If Required)

- A small quantity of water will discharge from the PTR valve during normal operation during the heating cycle of the water heater. Continuous and ongoing leakage of water from the valve and its drain line may indicate a problem with the water heater.
- If the valve leaks continuously but by not a large amount, then there may be foreign matter inside the valve. Locate a bucket to place under valve and ease the valve gear for a few seconds to dislodge the debris.
- HOWEVER, if the valve discharges at high flow this may be because the water pressure is exceeding the design pressure of the water heater. Ask your installer or local plumber to heater. fit a Pressure Limiting Valve (PLV).

WARNING

In order to minimize the risk of fire or explosion, electric shock, or to prevent property damage, personal injury, or loss of life, please follow the information in this manual. Before attempting to install or operate this water heater, be sure to read and understand the entire Use and Care Manual.

STOP if you have any issues understanding the instructions in this manual and get help from a local plumber, local plumbing authority, local electric utility, or qualified service technician.

Safety Precautions

- Know the location of the circuit breaker and how to shut it off if necessary. If you cannot find the circuit breaker, ask the installer to locate it for you. Should the water heater be subjected to overheating, fire, flood physical damage or if the ECO (temperature limiting control) fails to shut off, turn off the circuit breaker IMMEDIATELY.
- Local codes and the provided installation instructions should be used to ensure your appliance is properly installed.
- Servicing should be referred to a qualified technician. DO NOT repair or replace any part of your water heater unless it is specifically recommended in this manual.
- DO NOT attempt to repair any part associated with the sealed refrigerant system.
- MAKE SURE the water heater is completely filled with water BEFORE turning on the electrical supply.

CAUTION

In order to avoid a hazard due to inadvertent resetting of the THERMAL CUT-OUT, this appliance must not be supplied through an external switching device, such as a timer, or connected to a circuit that is regularly switched on and off by the utility.

WARNING

COMPRESSOR IS NOT SERVICEABLE; DO NOT ATTEMPT TO SERVICE COMPRESSOR.

The pressurized refrigerant and oil can escape if the compressor wiring terminals arc. This can cause the compressor to ignite and cause serious bodily injury, severe burns or death.

WARNING

BEFORE starting maintenance, disconnect all power to unit in order to avoid electrical shock resulting in severe personal injury or death.

A water heater equipped with an adjustable temperature-regulating control shall be provided with instructions that: Inform the user that the thermostat, as applicable, has been set at the factory to 120°F (49°C) or lower, to reduce the risk of scald injury (For CAN -factory set to 140°F(60.0°C)).

WARNING

DO NOT EVER replace the PTR valve with one which has a higher pressure rating than is specified for your water heater; This can result in damage to the water heater and create unsafe conditions.

Read And Follow This Safety Information Carefully

NOTICE

SAVE THESE INSTRUCTIONS.

WARNING

When using electrical appliances, basic safety precautions to reduce the risk of fire, electric shock, or injury to persons should be followed, including: READ ALL INSTRUCTIONS BEFORE USING THIS WATER HEATER. This water heater must be grounded. Connect only to properly grounded outlet. See "GROUNDING INSTRUCTIONS" page 18.

Install or locate this water heater only in accordance with the provided installation instructions.

Use this water heater only for its intended use as described in this manual.

As with any appliance, close supervision is necessary when used by children.

This water heater should be serviced only by qualified service personnel. Contact nearest authorized service facility for examination, repair, or adjustment.

Do not use multi-outlet adaptors (i.e. power strips) with this water heater.

Refrigerant

This Hybrid Water Heater is factory charged with R134a; do not attempt to service refrigerant.

Operating Principle

The electric heat pump operation is a reverse of a refrigerator's operation. The heat pump transfers heat from the ambient outside air into the water. Electricity is only used to operate the system.

The heat pump system will be more efficient at heating water during warmer ambient conditions.

There is a micro-channel heat exchanger wrapped around the inner cylinder; this is to allow for thermal conductivity between the refrigerant in the tank. A suitable tank temperature is achieved by using a temperature sensor in the tank.

In the event that ambient weather conditions are not suitable for the heat pump to operate, the electric element will provide heating to ensure operator-owner will have a supply of hot water.

INSTALLATION INSTRUCTIONS

The location chosen for the water heater must take into consideration the following:

Local Installation Regulations

Follow the instructions in this manual, local codes, utility codes, utility company requirements or, in the absence of local codes, the latest edition of the National Electrical Code while installing this water heater. These materials are available from some local libraries. These materials also be purchased from the National Fire Protection Association. Batterymarch Park, Quincy, MA 02269 as booklet ANSI/NFPA 70. For Canadian owners, please refer to Canadian Standards Association, 5050 Spectrum Way, Mississauga, ONT L4W 5N6 to purchase standard CSA22.1.

Installation should be avoided in an environment where flammable and explosive gases are leaking or where there are strong corrosive gases.

Location

Locate a clean dry area for your water heater and position it as near as practical to the area of greatest heated water demand. Please understand that long un-insulated hot water lines can waste energy and water.

Ensure that the thermistor and element access panels can be removed when choosing a location for the water heater. This is to permit inspection and servicing such as removal of elements or checking controls.

Protect the water heater and water lines from freezing temperatures, AVOID installing the water heater in outdoor, unprotected areas.

The floor underneath the water heater MUST be strong enough to support the weight of the water heater after being completely filled with water.

Where applicable, install a floor isolation kit is recommended to minimize vibrations.

CAUTION

The Water Heater should not be located in an area where leakage of the tank or connections will result in damage to the area adjacent to it or to lower floors of the structure. Where such areas cannot be avoided, it is recommended that a suitable drain pan, adequately drained, be installed under the water heater.

Inspect Shipment

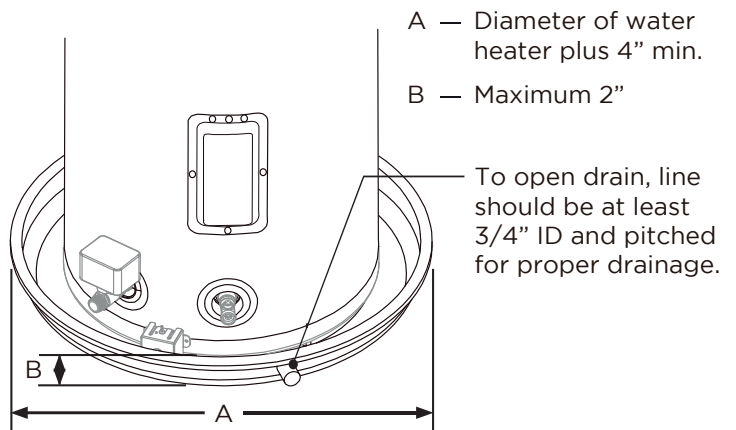

Check the water heater for possible shipping damage after receiving the unit. Be certain that the power supply corresponds to the water heater requirements by checking the marking on the rating plate. Rating plate is located on front of water heater.

NOTICE

If adequate ventilation is not provided for installs inside confined spaces, the unit will have higher power consumption.

DO NOT install the hybrid water where ambient temperatures EXCEED 114°F (46°C)

| Clearances | | |
|------------|-------|-----|
| Rear | Sides | Top |
| 0" | 6" | 20" |

NOTICE

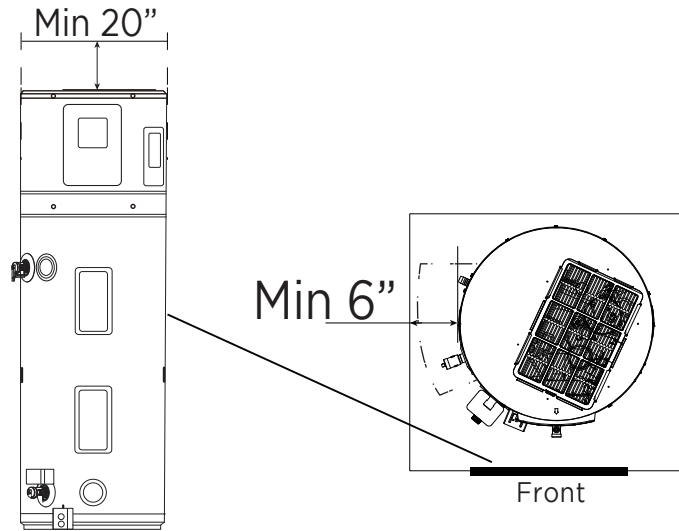

ENSURE that the auxiliary drain pan conforms to local codes.

Purchase drain pan kits from the store where the water heater was purchased, or any water heater distributor. ENSURE that the drain pan DOES NOT obstruct cold inlet or drain valve.

The clearance requirements of this water heater as follows:

| Minimum Required Clearances | | | |
|-----------------------------|-----------|------------|-----|
| Back | Left Side | Right Side | Top |
| 0 | 0 | 6" | 20" |

This installation clearance is required for both 50 and 80 gallon heaters

Duct Adapter Kit

NOTICE

Must be installed by professionals. It is recommended to adjust the engineering channel 40(Detail operation please look at the part of "OPERATING INSTRUCTIONS→Setting Menu "in the USE&CARE MANUAL) after installing the air duct to achieve better performance. When installing the ducting , obstacles need to be kept at a certain distance from the duct adapter, as shown in "F" (Fig1); the headroom required for installation is shown in "G"(Fig1). Objects around the duct need to be more than 1 inch away from the duct.

Ducting Requirements

Before designing the duct system, always check with local building and HVAC codes. Read these instructions carefully for ducting unit to outdoors or other spaces. Any ducting configurations that do not comply with these instructions are not supported.

This water heater **MUST** be ducted separately from other appliances. Only use ducting approved for HVAC applications. **ENSURE** ducting is adequately supported and that terminations are used.

HVAC approved indoor registers are required.

To minimize transmission of vibration or noise, rigid ducting must be isolated from floor joists or other structural members. Utilize a short section (12 in. or larger) of flexible duct between the water heater and rigid ducting as an isolation method.

Every foot of flexible ducting counts as three feet of rigid ducting. Ducting must be insulated per HVAC codes (to prevent condensation).

Cold air **MUST** exhaust is sufficiently away from structures to prevent condensation on surfaces. Lowering resistance to airflow and regular filter maintenance will maximize heater performance.

Providing unit with warm moist air is also beneficial to the performance of the water heater.

Considerations when planning the duct system:

- Use direct route for running the ducting. For best airflow, reduce elbows/bends used in layout as much as possible.
- Utilize largest duct size for project that is allowable for install.

- Utilize largest termination possible for ductwork. The length of duct is the length on the inlet plus the length on the outlet. You may use any combination of duct lengths to reach max. duct length in Table 1.

Table 1 - Maximum Duct Length

| Duct Type / Diameter | 8" | 7" | 6" | 5" |
|----------------------|------|------|-----|-----|
| Rigid | 357' | 168' | 68' | 18' |
| Flexible | 131' | 68' | 26' | -- |

NOTICE

All ducting accessories and installation need to follow local electrical installation and building code. When the installation is completed, the equivalent pressure load needs to be less than 45 Pa or the airflow at the outlet of the water heater needs to be no less than 150 m³/h. If the static pressure is higher than 45Pa or the airflow at the outlet is less than 150m³/h, the efficiency will reduce more than 20%.

When the unit is running in a high humidity environment, it is recommended to add sponge wrapping at the air outlet duct to reduce the generation of condensation water.

Duct System Configuration

Use 8 in. diameter ducting for inlet and outlet ducting connections on the water heater.

Note that 7 inch, 6 inch, 5 inch diameter ducting are supported. Total feet of ducting allowed is in Table 1.

Accessory Installation Requirements (not included)

Elbows/Bends

An elbow is defined as a rigid duct with a flex bends greater than 45°.

If a bend is needed that has a tighter radius than its diameter, then a rigid elbow must be used.

Terminations/Registers

Smaller diameter terminations and registers with more than a 2 ft. connection should not be used.

The angle of the duct adapter needs to be maintained at an inclined angle to avoid rainfall backflow.

NOTICE

These accessories will increase the load static pressure throughout the piping system and will reduce airflow.

Damper

An approved damper should be installed no further than 10 ft. of rigid ducting total (two elbows equivalent) from the unit if ducting to the outside while using an exhaust duct only (no intake duct). This action will prevent outside air from entering the living space.

Transport and Handling

Positioning The Heat Pump

- Perform a Work Method Statements (WMS) or Job Site Analysis (JSA) on site to ensure safety. Be careful to unload all materials in a safe manner.
- For ease of unloading, position vehicle with all materials and the unit in a position near the work area.
- Installer **MUST** consider impact to living areas caused by noise of the water heater. Avoid positioning unit against wall shared with neighbours' bedrooms. The water heater is expected to run at night and noise caused by the unit (while low) can be considered interruptive to inhabitation of the home.
- **MAINTAIN** access to the relief valve and anodes.
- **OBSERVE** all plumbing and building regulations while installing unit. **ENSURE** the unit is installed on a flat and level surface.
- To prevent property damage from water spillage, you **MUST** use a properly drained overflow tray (See AS/NZS 3500.4.2 for further details.)
- **DO NOT** drain into gardens or outdoor areas containing greenery.
- **DO NOT** start the job of installing the water heater when risks cannot be controlled.
- **ENSURE** 200m² of free space to provide clear ambient airflow around the water heater; this helps the water heater's performance. This free space must be clear of debris, stored items, tree branches, and obstructive elements.

Install a plinth under the heat pump where it is subjected to wet conditions

NOTE

- **DO NOT** drain on to grass or garden beds.
- **DO NOT** commence a job where the risks cannot be controlled.
- Allow 200m³ of free space surrounding the unit. This provides clear ambient air flow assisting the product's performance. Ensure the clearance requirements specified in the section 'Location' on page 8 are complied with. The area **MUST** also be clear of debris such as leaves and tree branches.

Thermal Expansion

An open water system occurs if a cold water inlet line does not have a check valve or back flow prevention device. This can cause a problem when thermal expansion occurs. Thermal expansion is the increase in pressure and volume that water undergoes when it is heated. In an open water system, this thermal expansion of the water exceeds the capacity of the water heater and then flows back into the city main where the pressure is easily dissipated.

In contrast, a closed water system, prevents the expanding water from flowing back into the main supply line. This can create a rapid and dangerous pressure increase in the water heater and system piping, which will activate the safety setting of the relief valve. When the relief valve is constantly activated, it will cause premature failure. Please note that replacing the relief valve **WILL NOT** resolve the problem.

To control thermal expansion, please install an expansion tank in the cold water line between the water heater and the check valve. The expansion tank relieving the over pressure condition and prevents the relief valve from being activated regularly. The expansion tank is built to have an air cushion built in that compresses as the system pressure increases.

If you require more information on this subject, please contact your installing contractor, water supplier or plumbing inspector. It is important to extend your water heater's longevity by using an expansion tank.

Water Supply Connections

Refer to the illustration on Page 19 for water supply connections.

The HOT and COLD water connections use 3/4" NPT on all models. Please install a shut-off valve in the cold water line near the water heater. These appliances are intended to be permanently connected to the water mains, and shall not be connected by hose-sets. See page 16 for further instruction on "To Fill The Water Heater".

Water inlet or outlet pipes: The spec of the water inlet or outlet thread is 3/4" NPT (external thread). Pipes must be heat-resistant and durable. The outlet of drain pan should be connected to the drainage system by DETACHABLE HOSE -SETS the new hose-sets supplied with the appliance are to be used and that old hose-sets should not be reused.

Installation of the pipe for PTR valve: The valve connecting thread is 3/4" NPT (internal thread). After installation, it must be confirmed that the drainpipe outlet is exposed in the air. All piping properly installed and free of leaks. Unit completely filled with water. Tempering valve installed per manufacturer's instructions. The water in this appliance does not need to be potable, if a potable water source is used for the equipment's water supply, the source water supply shall be protected against back siphonage by the equipment. Besides, The water inlet or outlet of the equipment is unpotable. A one-way valve must be installed on the water inlet side, as well as an isolation valve. It is normal for some water to be released from the PTR valve during operation. But, if there is a large volume of water, call your service agent for instructions. After long term use, check the unit base and fittings.

If damaged, the unit may sink, resulting in injury. Arrange the drain pipe to ensure smooth draining. Improper drainage work may cause wetting of the building, furniture etc. Do not touch the inner parts of the controller or remove the front panel. Some parts inside are dangerous to touch, and damage may be caused.

NOTICE

DO NOT apply heat or heating processed to the **HOT** or **COLD** water connections during installation; doing so will damage the heat traps. Connect the hose to the adapter before installing the adapter to the water connection on the heater.

Condensate Drains

Consult local codes or ordinances for specific requirements. Refer to page 16.

IMPORTANT: When making drain fitting connections to the drain tubing, use a clamp secure.

IMPORTANT: When making drain fitting connections to the drain tubing, **DO NOT** overtighten. Overtightening fittings can split pipe connections on the drain pan.

- For more requirements, please consult local codes or ordinances. Refer to page 10.
- **IMPORTANT: USE SECURE CLAMPS** when making drain fitting connections to the drain tubing.
- **IMPORTANT: DO NOT** over-tighten when making drain fitting connections to the drain tubing. Overtightening fittings can split pipe connections on the drain pan.
- **DO NOT** reduce drain line size less than connection size provided for the condensate drain.
- To ensure proper drainage, pitched drain lines downward away from the unit a minimum of 1/8" per foot of line include a P-trap in drain line if it is connected to a sewer pipe.
- **DO NOT** allow water heater drain pan to be used as a condensate drain.
- **INSULATE** the drain line to prevent sweating and damage due to condensate forming on the outside surface of the line.

NOTICE

Condensate is not required to be neutralized from this unit because it is not acidic.

Typical Installation

A temperature and pressure relief valve (that complies with the Standard for Relief Valves for Hot Water Supply Systems, ANSI Z21.22) is factory installed and must remain installed.

DO NOT install a valve of any type between the relief valve and the tank.

Relief Valve (T&P Valve)

Look at the rating label of the water heater, the btu/h rating of the relief valve must not be less than the input rating listed (1 watt = 3.412 btu/h).

DO NOT allow discharge water to contact live electrical parts. Make sure that the relief valve is connected to a suitable open drain.

ONLY use piping that is approved for hot water distribution. The outlet of the valve and must pitch downward from the valve. This allows complete drainage (by gravity) of the relief valve and discharge line. The discharge line should be protected from freezing.

DO NOT install a valve of any type, restriction or reducer coupling in the discharge line.

CAUTION

To reduce the risk of excessive pressures and temperatures in this water heater, install temperature and pressure protective equipment required by local codes and no less than a combination temperature and pressure relief valve certified by a nationally recognized testing laboratory that maintains periodic inspection of production of listed equipment or materials, as meeting the requirements for Relief Valves and Automatic Gas Shutoff Devices for Hot Water Supply Systems, ANSI Z21.22. This valve must be marked with a maximum set pressure not to exceed the marked maximum working pressure of the water heater. Install the valve into an opening provided and marked for this purpose in the water heater, and orient it or provide tubing so that any discharge from the valve exits only within 6 inches above, or at any distance below, the structural floor, and does not contact any live electrical part. The discharge opening must not be blocked or reduced in size under any circumstances.

WARNING

The pressure rating of the relief valve must **NOT** exceed the maximum working pressure of the water heater as marked on the rating place (150 PSI).

WARNING

T&P plumbing MUST go directly to a suitable open drain.

T&P MUST NOT connect to the condensate plumbing.

To Fill the Water Heater

Ensure the closure of the drain valve before starting this process. For the cold water supply line, open completely.

Allow the air to vent from the water heater and piping by opening each hot water faucet slowly to allow. A steady flow of water from the hot water faucet(s) indicates a full water heater.

Built-in leak detection and automatic water shut off valve protect the water heater. The app is notified if there is a trigger for leak detection and the unit will shut down.

WARNING

The manufacturer's warranty will be void if installer or owner fails to follow the instructions provided in this manual. Failure to follow directions in manual may permanently damage the unit.

WARNING

ENSURE the water heater is completely filled with water before turning on the electrical supply. If the water heater is operated with an empty or partially empty tank, the warranty does not cover the resulting damage or failure.

Electrical Connections

WARNING

Before making any electrical connections, turn off electric power at the fuse box or service panel. ENSURE ground connection is completed before making line voltage connections. Death, injury, or electrical shock can result in failure to do so. Also, before any maintenance, disconnect all power to unit before starting maintenance. DO NOT operate the water heater if the water heater has been subjected to fire, flood or physical damage, until it has been checked by a qualified service technician.

A qualified electrician be commissioned to provide a separate branch circuit with copper conductors, over current protective device and suitable disconnecting, Latest edition of National Electrical Code ANSI/NFPA 70 and all local codes must be conformed to for wiring.

Water Heater Junction Box

Junction Box Details

NOTICE

If this water heater or any part of this water heater has been under water and/or flooded, DO NOT attempt to repair the unit! It must be replaced.

Grounding Instruction

1. Metallic conduit or metallic sheathed cable (approved for use as a grounding conductor). These must be installed with fittings approved for the purpose.
2. A separate conductor for grounding shall be included for non-metallic sheathed cable, metallic conduit or metallic sheathed cable not approved for use as a ground conductor.
3. The unit in must be installed with a circuit breaker (including GFCI type) near the power supply and must be effectively earthed.
4. All wires connection refer to page 39.

NOTICE

Refer to National Electric Code. Refer to wiring diagrams in this manual for field wiring connections.

Branch Circuit Sizing And Wire Size Guide - Single Phase Wiring

| Maximum Wattage | Recommended Over Current Protection (Fuse or Circuit Breaker Amperage Rating) | | Copper Wire Size AWG Based on NE.C Table 310-16 (75°C) |
|-----------------|---|------|--|
| | 208V | 240V | |
| 5500 | 25 | 30 | 10 |

NOTE: When sizing the breaker and wire for over current protection, include an additional 500W to the upper element wattage rating for the maximum amperage draw of the compressor and fan motor.

WARNING

MAKE SURE unit is full of water before turning on the electrical supply or operating this water heater.

CAUTION

Note that the presence of water in the piping and water heater does not provide acceptable conduction for a ground. The water heater can become electrically isolated if non-metallic piping, dielectric unions, flexible connectors etc. are used.

Insulation Blankets

WARNING

Follow the manufacturer's instructions on insulation blanket kits included with the kit carefully if local codes require external application of insulation blanket. An insulation blanket can reduce standby heat loss. This manufacturer's warranty does not claim responsibility for any damage or defect caused by installation, attachment or use of any type of energy saving or other unapproved devices (other than those authorized by the manufacturer) into, onto or in conjunction with the water heater.

CAUTION

If local codes require the application of an external insulation blanket to this water heater, pay careful attention to the following so as not to restrict the proper function and operation of the water heater:

- Operating or warning labels attached to the water heater **MUST STAY** visible.
- **Air openings on both sides of the water heater MUST STAY OPEN.**
- **Controller Assembly, temperature and pressure relief valve or drain valve SHOULD NOT** be covered.
- Frequently inspect the insulation blanket.

Hot and Cold Pipe Insulation Installation

Install the insulation on the cold water supply inlet and the hot water outlet as shown in the illustration.

OPERATING INSTRUCTIONS

Operating The Water Heater

CAUTION

Hydrogen gas (EXTREEMLY FLAMMABLE) can be produced in a hot water system served by this water heater that has not been used for a period of two weeks or more. It is recommended that the hot water faucet be opened for several minutes at the kitchen sink before using any electrical appliance connected to the hot water system.

You will hear a strange sound of air escaping if hydrogen is present. Do not have open flame or smoke near any facet if this is the case.

Safety Precautions

1. If water heater if it has been subjected to over heating, fire, flood, or physical damage, disconnect the power.
2. Fill water heater completely before turning water heater.
3. If cold water supply shut-off valve is closed, DO NOT turn on water heater.
4. It is recommended that a qualified person or serviceman perform the work.

WARNING

If the water heater has been subjected to fire, flood or physical damage, disconnect all power to water heater. DO NOT operate the water heater again until it has been checked by a qualified service technician.

NOTICE

DO NOT use this appliance if any part has been under water. Immediately call a qualified installer or service agency to replace a flooded water heater.

DO NOT attempt to repair the unit! It must be replaced.

Safety Controls

The water heater is equipped with a temperature limiting control (ECO) that is located above the upper heating element in contact with the tank surface. If for any reason the water temperature becomes excessively high, the temperature limiting control (ECO) breaks the power circuit to the heating element. Once the control opens, it must be reset manually.

Resetting ECO

The cause of the high temperature condition must be investigated by qualified service technician and corrective action must be taken before placing the water heater in service again.

To reset the temperature limiting control (Refer to illustration in Cavity Insert section):

1. Disconnect all power to unit before starting maintenance.
2. Remove the upper cavity cover and insulation.
3. Press the red RESET button.
4. Replace the insulation, jacket access panel and plastic housing before turning on the power to the water heater.

Operating The Water Heater (cont.)

DANGER

There is a hot water scald potential if the thermostat is set too high. Households with small children, disabled, or elderly persons may require a 120°F (49°C) or lower thermostat setting to prevent contact with **HOT** water.

Water Temperature Setting

The temperature of the water in the water heater can be regulated by selecting the desired temperature on control display. Safety and energy conservation are factors to be considered when selecting the water temperature setting of the water heater. The lower the temperature setting, the greater the savings in energy and operating costs.

To comply with safety regulations the temperature is factory set at 120°F (49°C) (For CAN -factory set to 140°F(60.0°C) or less where local codes require. This is the recommended starting point. Severe burns can occur from hot water.

Be sure to read and follow the warnings outlined in this manual and on the label on the water heater.

This label is located on the front of the water heater.

Mixing valves are recommended for reducing point of use water temperature by mixing hot and cold water in branch water lines. It is recommended that a mixing valve complying with the Standard for Temperature Actuated Mixing Valves for Hot Water Distribution Systems, ASSE 1017 be installed. See page 4 for more details and contact a licensed plumber or the local plumbing authority for further information.

When used in demand response applications a thermostatic mixing valve conforming to ASSE 1017 shall be installed on the hot water supply line following all manufacturer installation instructions. See page 35 for additional installation information.

The chart on the page 4 may be used as a guide in determining the proper water temperature for your home.

CARE & CLEANING

Draining the Water Heater

⚠ CAUTION

Be sure to shut-off power to the water heater before attempting to drain the water heater.

⚠ DANGER

Before manually operating the relief valve make certain no one will be exposed to the hot water released by the valve to avoid any scald risk, injury or damage.

Do not use volatile oils, alcohols, thinners, lacquers, etc. to clean the machine; otherwise, the product may be damaged.

Turn off the cold water supply before drain the water heater.

Attach a garden hose to the drain valve on the water heater, open the T&P valve, and direct the stream of water to a drain. Open the valve.

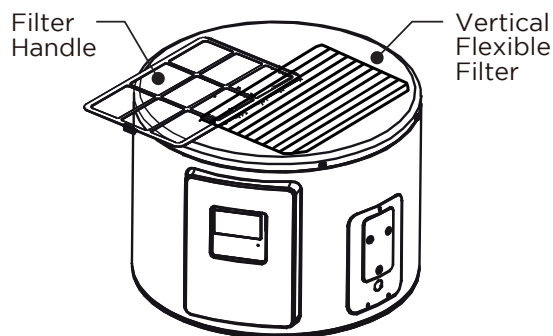

Routine Preventative Maintenance

Your water heater will provide years of dependable trouble free service if you maintain your water heater properly. However, contact a qualified installer or plumbing contractor to inspect unit if you see or hear any strange behavior.

Annually you must:

1. Lift and release the lever handle on the temperature pressure relief valve and allow water to discharge from the system.
2. Clean the air filter (or more often as needed). A clean filter is important for keeping air flow to heat pump from being obstructed.
3. Pour bleach down the condensate drain.
4. Check that the condensate can flow freely.
5. Drain water heater to clear debris accumulated in tank from hard water deposits.

Vacation and Extended Shut-Down

NOTICE

Refer to the Hydrogen Gas Caution in the Operating Instructions.

The power and water to the appliance should be turned off to conserve energy and prevent a build-up of dangerous hydrogen gas for periods of inactivity longer than 2 weeks.

If there is risk that the water heater and piping will be subject to freezing while the unit is inactive, the water heater and piping should be drained.

The water heater's operation and controls should be checked by qualified service person after a long shut-down period. Make sure to completely refill the water heater before placing it in operation.

Anode Rod

NOTICE

The life of the glass-lined tank can be prolonged by the anode rod as it prevents corrosion of the tank. Do not remove the anode rod.

The gas-lined tank of this water heater is protected by an anode rod. The purpose of this rod is to attract corrosive elements inside of hard water so that the anode rod is sacrificed to corrosion instead of the inside of the water heater. For cases where the water contains high mineral content or high sulfates, this process of the anode rod reacting to the water can cause an odor. This odor is similar to rotten eggs. This can happen especially during long periods of inactivity. In this case, the owner can use the chlorine bleach removal method by adding an automatic chlorination to the water system. The chlorine will eliminate the rotten egg smell because it chemically reacts with hydrogen sulfide and disinfects the water.

TROUBLESHOOTING TIPS

Before You Call For Service...

 Save time and money! Review the chart on this page first and you may not need to call for service.

Troubleshooting

1 Non-error tips

Q: Why won't the compressor start immediately after turning on the unit?

A: The pressure of the system needs to be balanced. This is a self-protection logic of the unit that should take 3-4 min.

Q: Sometimes the temperature shown on the display panel decreases while the unit is running, why is this?

A: The upper tank temperature and bottom tank temperature will mix when there is a temperature difference, thus lowering the reading. This is not abnormal operation.

Q: The display shows decreased temperature, but the unit is closed?

A: To avoid cutting on and off repeatedly, the machine will turn on only when the T5U temperature is lower than the setting temperature for at least 5°C (50 Gal)/4°C (80 Gal).

Q: Why sometimes the temperature shown on the display decreased but I still have hot water?

A: The upper water sensor is positioned on the upper 1/4 of the water heater and therefore there is still about 1/4 of the tank of hot water available to the user.

Q: Why is it that sometimes the buttons are unavailable?

A: Maybe the panel is locked, press the “” and “” for 2 seconds, the unit will lock the panel, shows “”, to unlock the panel, please press the “” and “” for 2 seconds again.

Q: Sometimes there is some water that flows from the drainage pipe of the PT valve, why does this occur?

A: Because the tank is a pressure-bearing one, when water is heated inside the tank, water will expand, so the pressure inside the tank will increase, if the pressure goes up more than 1.0 MPa, the PT valve will activate to relieve the pressure and hot water drops will be discharged correspondingly. If water drops are continually discharged from the PT valve drainage pipe, it is abnormal, please contact qualified staff to check.

2 Self-protection of unit

1. When the self-protection happens, the system will be stopped and start self-check, and restart when the protection is resolved.

2. When the self-protection happens, the buzzer will buzz in all the time, the “” light will light up and an error code will be shown at the water temperature indicator. The “” and error code do not disappear until protection is resolved.

3. In the following circumstances, self-protection may happen;

- Air inlet or outlet is blocked;
- The evaporator is covered with too much dust;
- Incorrect power supply (exceeding the range of 187-265V).

3 Recognizing an Error

1. If some normal errors happen, please contact qualified staff to repair.

2. If some severe error happens, the unit will not start, please contact qualified staff to repair.

3. If a fault occurs, the “” icon will light up, the buzzer will beep and the main interface will display a fault code.

| Setting the date and clock |  | <p>1) In the main interface, press and hold the timer button for 3 seconds to enter the date setting, press the up/down button to select the date, press the confirmation button to enter the clock setting, press the up/down button to modify the time, and press and hold to accelerate the increase/decrease of the time. After setting the clock, press the confirm button to return to the main interface to complete the setting of date and time.</p> <p>(2) After 30 seconds from the last operation of the up/down button or pressing the return button or the power on/off button, you can directly exit the date and time setting;</p> <p>3) Setting can be done in both power-on and power-off state.</p> |
| Connecting the wireless function |  Press for 3 sec | <p>1) In the main interface, long press the on/off key for 3 seconds to enter the AP wireless network mode, there will be a wireless icon in the upper right corner of the line controller. At this time, enter the APP, select the category of air water heater, choose the correct model, and then network according to the APP prompts, and after the network is completed, the wireless icon will be always on;</p> <p>(2) Wireless matching can last up to 8 minutes, after 8 minutes, if the matching is not successful, the wireless icon will go out;</p> <p>3) Long press the delete button for 8 seconds in the main interface to reset the wireless function;</p> <p>4) It can be set in both power on and power off state.</p> |
| Child lock function |  Press for 2 sec | <p>1) In the main interface, long press the key combination for 2 seconds to enter the child lock state;</p> <p>(2) In the state of child lock, long press the key combination again for 2 seconds to release the child lock state;</p> <p>3) In the locked state, there will be an icon  next to the water temperature display.</p> |

|---------|--|--|
| EH0b | Tank and LCD panel communication error. | If the connection between LCD panel and PCB has released or PCB has been broken. |
| EH00 | Machine working parameters are abnormal. | Contact a qualified person to service the unit. |
| EH03 | DC fan fault. | If the connection between fan and PCB has released or fan has been broken. Contact a qualified person to service the unit. |
| PH15 | Electric leakage error. If PCB current_induction_circuit check the current difference between L,N > 14mA, system consider it as "electric leakage error". | If some wires have been broken or bad wire connection. Contact a qualified person to service the unit. |
| EC54 | Compressor discharge temperature sensor TP error. | If the connection between sensor and PCB has released or sensor has been broken. Contact a qualified person to service the unit. |
| EH5H | Compressor suction temperature sensor TH error. | |
| EC53 | Ambient temperature sensor T4 error. | |
| EC52 | Evaporator temperature sensor T3 error. | |
| EH5L | Error of sensor T5L (lower water temperature sensor). | |
| EH5U | Error of sensor T5U (upper water temperature sensor). | |
| EHLA | When the ambient temperature T4 is out of the compressor operating range, the compressor stops, and EHLA is displayed until T4 returns to the normal range. Only works on units without electric heaters. Devices with electric heaters will never display "EHLA". | It is normal, and no necessary to repair. |
| EH5d | Electric heater open-circuit error. | If the electric heater has been broken or bad wire connection after repair. |
| EHHP | Heat pump system fault. When PH20, PH21, PC30, PC06 any protection appears 3 times or the protection lasts 1 hour. | The compressor works abnormally. Contact a qualified person to service the unit. |
| PHdH | Dry burning protection. | Ensure that there is water in the water tank before heating. |
| PH20 | Compressor abnormally stopped protection. The discharge temperature is not so higher than evaporator temperature after compressor running a term. | If the compressor broken or bad connection between PCB and compressor. Contact a qualified person to service the unit. |
| PH21 | The working current of the compressor is too large. | If the compressor is broken, system blocked, air or water or more refrigerant in system (after repair), water temperature sensor malfunction, etc. Contact a qualified person to service the unit. |
| PH24 | Frost protection. T5L < 4°C(39.2 °F) and T4 < 7°C(44.6 °F) . | The cold water temperature is too low, which will affect the water tank. The electric heater will work. |
| PC30 | System high pressure protection ≥ 3.0 MPa active; ≤ 2.4 MPa inactive | If the system is blocked, air or water or more refrigerant in system (after repair), water temperature sensor malfunction, etc. Contact a qualified person to service the unit. |
| PC06 | High TP protection. Tp > 105°C(221°F). Protection active; Tp < 90°C(194°F) Protection inactive. | If the system blocked, air or water or less refrigerant (leakage) in system (after repair), water temperature sensor malfunction, etc. Contact a qualified person to service the unit. |
| PH9b | Overtemperature protection. The current water temperature exceeds the target temperature by more than 5°C(41°F). | The water temperature sensor is faulty or the current water temperature is too high. In case of burns, contact a qualified person to check. |
| PH91 | Low T3 protection. | If the fault persists. Contact a qualified person to service the unit. |
| PH22 | Chassis leakage protection. | Check if the chassis is leaking water. If there is any leakage. Please clean and check the leakage port or contact after-sales personnel. |
| PHL1 | Leakage protection of the water tray. | Check if the drain tray is leaking. If there is any leakage. Please clean and check the leakage port or contact after-sales personnel. |
| FC06 | Electric ball valve malfunction. | Check if the electric ball valve is working properly. If it does not work properly. Please replace it or contact after-sales personnel. |

CUSTOMER SERVICE

CTA Module Wiring

Water Heater Junction Box

WARNING

A qualified technician must install a separate branch circuit with copper conductors and an over current protective device. He must also provided a suitable disconnecting means.

Please consult National Electrical Code ANSI/NFPA70 for wiring best practices.
Please consult local codes.

Install the Adaptor on the top right side of water heater (as shown in Fig8.1) .To gain access of the port, remove 3 screws holding junction box cover and connect the Adaptor to the port.

NOTICE

Look at the manufacturer instructions for the CTA2045 (that is ACTA2045 compliant) .

Demand Response (CTA-2045) Installations

A thermostatic mixing valve conforming to ASSE 1017 shall be installed on the hot water supply line following all manufacturer installation instructions.

Maximum and minimum inlet water operating temperatures 9°C-43°C;

Maximum and minimum inlet water operating pressures 0.3 MPa-1.03 MPa and flow rate 0.2-0.7(m³/h);

Replacement Parts

Instructions For Placing a Parts Order

Address parts orders to the distributor or store where the heater was purchased.

All parts orders should include:

1. The model and serial number of the water heater from the rating plate located on the tank jacket.
2. Specify voltage and wattage as marked on the rating plate.
3. Part description (as noted below) and number of parts desired.

NOTICE

Check the water heater's rating label on the front of the unit for the acceptable element wattage.

CAUTION

For your safety **DO NOT** attempt repair of electrical wiring, heating elements, heat pump or electronic controls. Refer repairs to qualified service personnel.

WARNING

FLAMMABLE CONTENTS UNDER PRESSURE.

The compressor is not a serviceable part. The compressor wiring terminals may be allowing pressurized refrigerant and oil to escape, ignite and cause serious bodily injury, severe burns or death.

The NetHome Plus App (cont.)

- ⚠️ Ensure that your mobile phone is connected to the home wireless network, the 2.4GHz band wireless signal is enabled on your wireless router and you know the network password.
- ⚠️ Turn on Bluetooth on your phone and the device must also be powered up.

1. Download NetHome Plus App

! CAUTION

The following QR code is only available for downloading App. It is totally different with the QR code packed with unit.
Android Phone users: Scan Android QR code or go to google play, search “Nethome Plus” App and download it.
IOS users: Scan IOS QR code or go to APP Store, search “Nethome Plus” app and download it.

Android

IOS

2. Register Or Login Account

Open the App and create a user account, if you already have one, just log in.

4. Choose Air Source Heat Pump Water Heater

3. Add Your Appliance

Tap the “+” icon to add home appliance to your NetHome Plus account.

5. Connected To The Network

Follow the instructions in the app to set up the Wireless connection.
If the network connection fails, please refer to the App tips for operation.
The actual UI design may look different from examples due to app updates.

Cavity Insert Instructions

CAUTION

The following instructions are intended for qualified service personnel **ONLY**, and should only be done when necessary.

In order to replace the ECO, thermistor or heating element, remove the cavity insert crossbar by following the instructions below:

1. Disconnect all power to unit before to starting maintenance.
2. Remove the cap.
3. Replace the ECO, thermistor and/or element as necessary.
4. Recover the cap before turning on the power to the water heater.

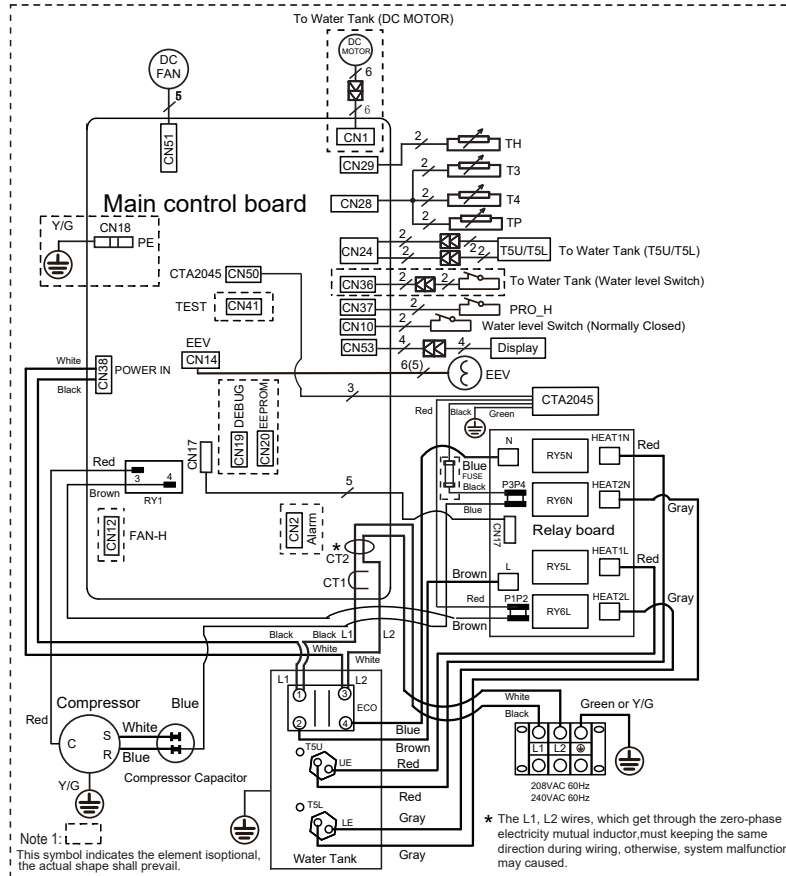

NOTICE

The cavity insert crossbar is necessary for the manufacturing process only.

The removal of the crossbar will not interfere with the operation of the water heater.
